

Your results

The seven areas the survey looks at. This is not a grade or a label: it is a picture of how you are set up right now, and that can change.

Player 5 · Wildcats Women's Tennis · 2026-08-25

WHERE YOU ARE STRONGEST

Discipline, habits and recovery
Confidence and inner dialogue

WHERE THERE IS ROOM

Relationships, communication and environment
Emotion regulation and performance under pressure

All seven areas

Identity and inner motivation

A STRENGTH

Measures how clearly you know who you are as an athlete, why you play your sport, and how firmly your self-worth rests on something more solid than your last result. It shows up most clearly in periods when results do not come.

You know who you are, why you compete, and what your worth rests on – and it holds even under pressure. A defeat stings, but it doesn't rewrite your value; within hours you can talk about what you're taking from it. You make decisions by your own criteria rather than by what's expected of you, and that gives you a calm that's noticeable in the locker room and on the field. Keep this area alive deliberately: return to your values at big decision points and use them as an anchor whenever another part of your game gets shaky. Watch one thing: a firm identity easily turns into an unwillingness to change anything. Once a season, check whether you are holding to a value or merely to a habit.

Confidence and inner dialogue

A STRENGTH

Measures how solid your belief in your own game is and how your inner voice speaks to you in training, in competition, and after a mistake. It matters most in moments when the stakes are high and there is no time to think.

Confidence and inner dialogue are strengths of your profile, and they hold up under pressure. You go into matches with belief grounded in your preparation, you talk to yourself in practical terms, and after a mistake you return quickly to the next task. That gives you a stability you can lean on in the decisive stretches of the season – and one your teammates can feel. The main risk is neglect: the routines and habits that keep this area strong need regular upkeep. Use it deliberately as an anchor while you work on the weaker parts of your profile, and keep exposing it to harder tests. More interesting than further growth is breadth: try holding this stability in a role you are not used to, or in a season that is playing for a different goal.

Concentration and attention control

A STRENGTH

Measures how well you lock attention onto what matters, hold it through distraction, and bring it back quickly when it slips. This is not about willpower but about a skill that can be trained.

Concentration is one of the pillars of your game. You hold attention on the cues that matter even in a loud arena, you come back quickly after mistakes, and the crowd or the referee rarely costs you more than a few seconds. Under pressure your focus narrows onto essentials instead of falling apart. That gives you an edge precisely in the moments when others start to scatter. Maintain this area deliberately: keep the routines that work and refresh them regularly so they stay sharp. And use it as an anchor – when another part of your game wobbles, returning to a clear point of focus is your most reliable way back. Good routines share one trait: they go stale. Once a month, walk through yours deliberately and check whether you are still doing it or merely going through the motions.

Emotion regulation and performance under pressure

UNSTEADY UNDER PRESSURE

Measures how accurately you read your body's signals and how well you steer emotion and arousal, so that the pressure of big moments lifts your performance instead of breaking it. It is most visible in the closing minutes, not in training.

The foundations are in place: you know what pressure does to you, and in ordinary matches you handle your emotions well. But when the stakes rise – a deciding endgame, a big start, a lead slipping away – your regulation stops being reliable. Sometimes you settle yourself exactly when you need to; other times the tension outgrows you and your performance swings. The goal of this phase is not to learn new tools but to make the ones you have automatic. That means training your breathing and reset routines directly under pressure, until they hold up when something is truly at stake. The transfer is the whole trick. Breathing you can do when calm means nothing; what counts is the breathing you can do when your heart is pounding.

Resilience and growth mindset

UNSTEADY UNDER PRESSURE

This dimension measures how firmly you believe your abilities can be trained, how long you can keep working without visible results, and how quickly you turn a loss or criticism into your next step. It shows most in a period when nothing improves for a long time.

You have the foundation of resilience – in calmer periods you treat mistakes as information and can work toward a long-term goal. Under pressure that approach crumbles: a string of losses, a long plateau, or sharp criticism can pull you back into doubt and old patterns. Your task now is not to learn something new but to stabilize what you already do, so it holds through the hardest weeks. Firm structure will help: the same routine for processing every loss, pre-written process goals, and a progress log you return to when results dry up. Consistency here comes from rituals, not mood – the worse things go, the tighter you hold them. A ritual proves its worth only in the worst week. So keep it simple enough that you can hold to it even when you feel like doing nothing at all.

Discipline, habits and recovery

A STRENGTH

This dimension measures how reliably you stick to your training habits regardless of mood or supervision, and how deliberately you manage sleep, recovery and energy. You recognise it by what you do on the days you do not feel like it.

Your routine is a genuine strength. You train reliably regardless of mood or supervision, you treat sleep and recovery as part of preparation, and you manage your energy with intent. That gives you stability to lean on in demanding periods – when form dips or pressure rises, your habits hold. Maintain this standard deliberately: review from time to time which habits are truly serving you, and make sure recovery scales up whenever the load does. Use this area as an anchor for the rest of your profile. Watch the ratio, not individual days: how many weeks in a row your routine held. It is the streak, not the perfect day, that makes the difference across a season.

Measures how open communication with your coach and team, healthy boundaries against outside pressure and the quality of your support base fuel your athletic performance. It is the one dimension shaped largely by the people around you.

Right now your relationships and environment are costing you more energy than they give back. You probably hide struggles from your coach or management, avoid uncomfortable conversations, and let pressure from family, club and social media go unchallenged for too long. This is not a personality trait – it is a missing skill, and it can be trained systematically. Start with one safe relationship where you say things straight, and one boundary stated out loud. Put this area first in your development plan, because without a functioning support base every other mental skill rests on unstable ground. Do not start with the hardest relationship. One well-handled conversation with someone safe teaches you more than a confrontation you are not ready for.

What to take from this

Your profile holds up best in discipline, habits and recovery and confidence and inner dialogue. That is what you can lean on when things get hard, and it is worth knowing that about yourself before you need it.

There is the most room in relationships, communication and environment and emotion regulation and performance under pressure. It is not a verdict; these are the parts that move fastest once somebody works on them deliberately.

Everything here describes how you are set up right now, not what you are like. Answering the same survey after a season of work usually looks different.
